BAB I

Deskripsi Masalah

HTML (Hypertext Markup Language) adalah bahasa markup yang digunakan untuk membuat struktur dan tampilan konten web. HTML adalah salah satu bahasa utama yang digunakan dalam pengembangan web dan digunakan untuk menggambarkan bagaimana elemen-elemen konten, seperti teks, gambar, tautan, dan media, akan ditampilkan di browser web. Setiap dokumen HTML dimulai dengan elemen html, lalu diikuti dengan head (untuk metadata dan tautan ke file eksternal) dan html, lalu diikuti dengan head (untuk metadata dan tautan ke file eksternal)

HTML menggunakan elemen-elemen (*tags*) untuk mengelompokkan dan mengatur konten. Contohnya, digunakan untuk paragraf teks, <h1> hingga <h6> digunakan untuk judul, <a> untuk tautan, untuk gambar, dan sebagainya. Elemen HTML sering memiliki atribut yang memberikan informasi tambahan tentang elemen tersebut. Contohnya adalah atribut src untuk gambar, href untuk tautan, dan class untuk memberikan elemen kelas CSS.

Sama seperti bahasa pada umumnya, HTML juga memiliki sintaks tersendiri dalam penulisannya yang dapat menimbulkan error jika tidak dipenuhi. Meskipun web browser modern seperti Chrome dan Firefox cenderung tidak menghiraukan error pada HTML memastikan bahwa HTML benar dan terbentuk dengan baik masih penting untuk beberapa alasan seperti *Search Engine Optimization (SEO)*, aksesibilitas, *maintenance* yang lebih baik, kecepatan render, dan profesionalisme.

Dibutuhkan sebuah program pendeteksi *error* untuk HTML. Oleh sebab itu, implementasikan sebuah program yang dapat memeriksa kebenaran HTML dari segi nama *tag* yang digunakan serta *attribute* yang dimilikinya. Pada tugas pemrograman ini, gunakanlah konsep Pushdown Automata (PDA) dalam mencapai hal tersebut yang diimplementasikan dalam bahasa Python.

BABII

Landasan Teori

2.1. HTML

HyperText Markup Language, atau HTML, adalah komponen fundamental dari World Wide Web. Ini menetapkan struktur dan makna konten web. Presentasi dan fungsionalitas halaman web biasanya dijelaskan oleh teknologi lain selain HTML. (CSS, JavaScript).

Tautan yang menghubungkan halaman web bersama-sama, baik dalam satu situs web atau di antara situs web, disebut sebagai "hipertekst". Salah satu komponen penting dari web adalah link. Anda dapat berpartisipasi aktif di World Wide Web dengan menerbitkan konten online dan membuat tautan ke halaman orang lain.

"Tags" yang mengelilingi nama elemen HTML dengan "<" dan ">" berfungsi untuk membedakannya dari teks lain di halaman. Nama elemen dalam tag tidak terpengaruh oleh kapitalisasi. Artinya, dapat ditulis dalam kombinasi huruf rendah dan huruf besar. Tag <title>, misalnya, dapat dinyatakan sebagai <Title>, <TITLE>, atau kombinasi karakter lainnya. Namun demikian, menulis tag dalam lowercase adalah prosedur standar dan disarankan.

2.2. Push Down Automata (PDA)

Pekerjaan teoritis pada komputasi mesin menggunakan pushdown automata. Mereka tidak begitu kuat seperti mesin Turing, tetapi mereka masih lebih kuat daripada komputer-komputer yang terbatas. Sementara non-deterministic pushdown automata dapat mengenali setiap bahasa bebas konteks, otomatis deterministik sering digunakan dalam desain parser karena mereka bisa mengenali bahasa bebas kontekstual.

PDA secara formal didefinisikan sebagai 7-tuple dengan aturan sebagai berikut:

$$M=(Q,\Sigma,\Gamma,\delta,q_0,Z,F)$$
 where

- Q is a finite set of states
- \bullet Σ is a finite set which is called the *input alphabet*
- ullet Γ is a finite set which is called the *stack alphabet*
- ullet δ is a finite subset of $Q imes (\Sigma\cup\{arepsilon\}) imes \Gamma imes Q imes \Gamma^*$, the transition relation
- $ullet q_0 \in Q$ is the start state
- ullet $Z\in\Gamma$ is the *initial stack symbol*
- ullet $F\subseteq Q$ is the set of accepting states

 δ adalah sebuah fungsi atau rule yang digunakan untuk menentukan perpindahan state dan flow dari PDA sesuai dengan parameter input.

2.3. Pengaplikasian PDA pada syntax HTML

Push Down Automata dapat diaplikasikan untuk membaca syntax HTML dan menyatakan apakah syntax yang sedang dibaca tersebut benar atau tidak. Dalam hal ini tupel PDA akan memiliki komponen sebagai berikut:

- Q berisi seluruh state yang dimiliki berdasarkan rules PDA.

- Σ berisi seluruh kemungkinan input, yang pada kasus syntax HTML berisi pembuka tag HTML seperti <head, <body, dan penutup seperti >.
- Γ berisi seluruh elemen stack
- δ berisi seluruh rules PDA yang ditetapkan.
- q_o adalah state awal

Sistem dari pengaplikasian PDA pada HTML adalah dilakukan pencarian tuple tiga berisi current state, input symbol, top stack symbol yang dipop, dan diharapkan dapat dikembalikan suatu tuple dua yang berisi next state dan top stack yang dipush. Current state dimulai dengan START, top stack awal adalah <Z>, dan akan terus dilakukan pengecekan tiap simbol input HTML yang telah diparsing terlebih dahulu. Ketika hasil pengecekan rule suatu tuple tiga tidak mengembalikan apa-apa, maka syntax HTML adalah tidak valid dan akan mengeluarkan pesan "Syntax Error". Jika next state yang diperoleh berupa state "ERROR", maka syntax HTML juga tidak valid dan akan mengeluarkan pesan "Syntax Error". Jika pengecekan seluruh input HTML dari awal sampai akhir berhasil mengembalikan hasil rule yang tidak berupa "ERROR" dan PDA berhasil sampai state terakhir FINISH, maka HTML dikatakan valid dan akan dikeluarkan pesan "Accepted"

BAB III

Hasil PDA

3.1. Total States

ATTRIBUTE HEAD BODY CONTENT HTML HTMLH HTMLHB START FINISH TABLE ERROR

3.2. Input Word Symbols

id="" class="" style="" href="" rel="" src="" alt=""
type="submit" type="reset" type="button" type="text"

listFile.append(tempTag)
# listFile = listFile.rem
```

Fungsi remove(a, b)

- Berfungsi untuk menghapus karakter ke-b dari string a

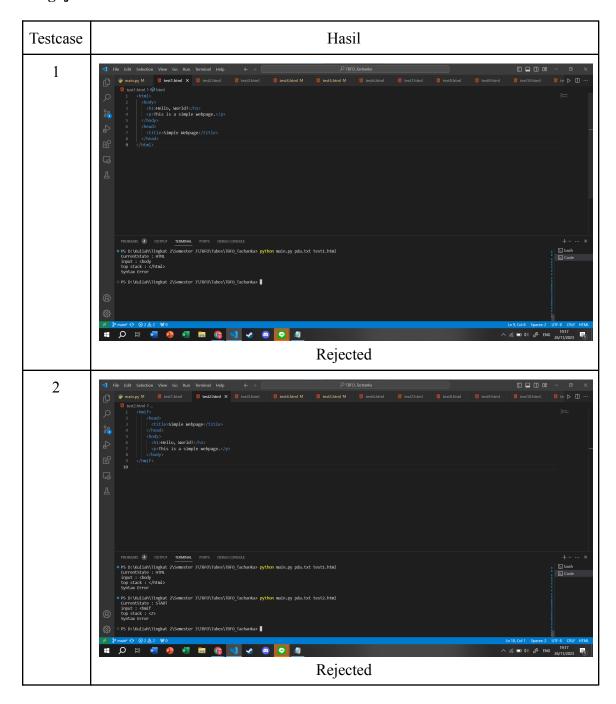

Fungsi parser(a)

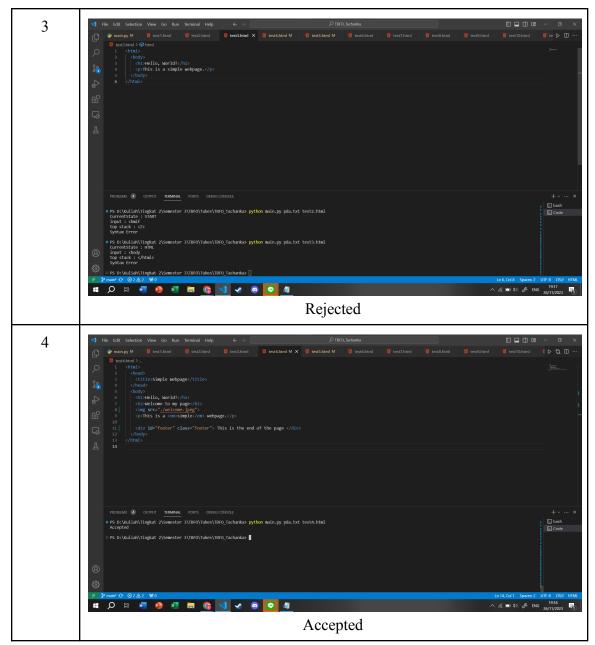

- Merubah file HTML menjadi token-token, dengan proses:
- 1. Mendekomposisi HTML menjadi opentag (<tag>), isi, dan closetag (</tag>).
- 2. Membersihkan white space.
- 3. Mengubah string di dalam tag menjadi token X.
- 4. Mendekomposisi opentag menjadi jenis opentag, atribut, dan >.

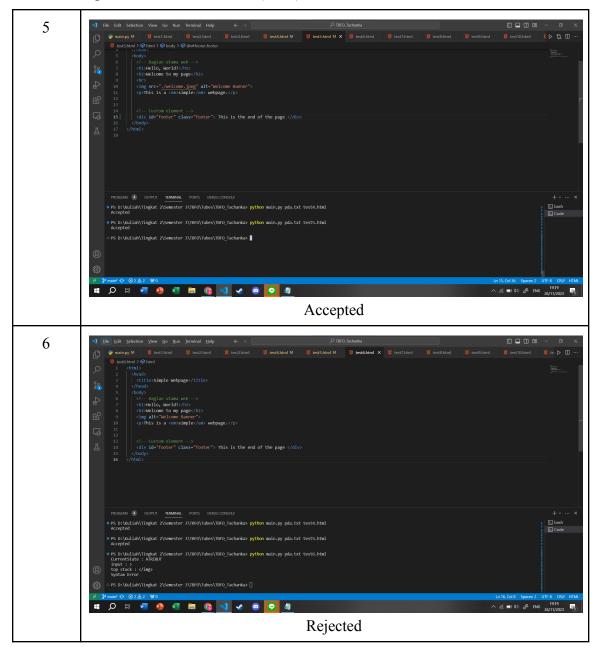

4.2. Main

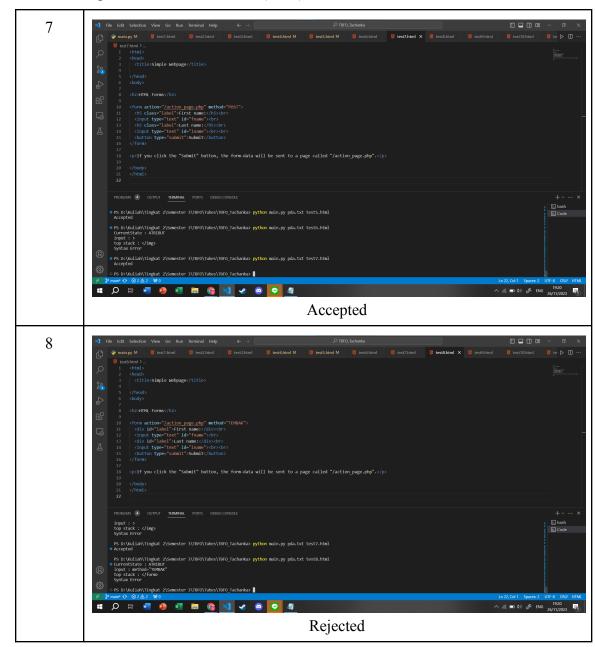

File main bertujuan untuk menerima nama file txt PDA, menerima nama file HTML yang ingin diakusisi, memanggil fungsi parser, dan melakukan proses validasi HTML berdasarkan PDA yang telah dipanggil.

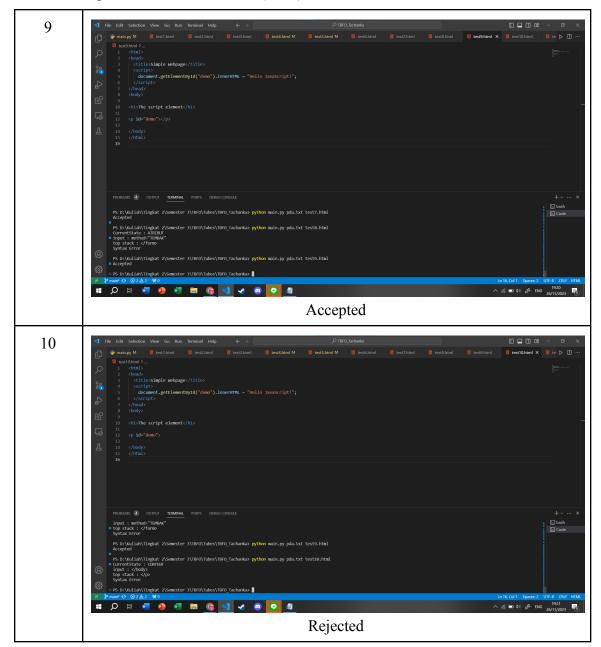

4.3. Pengujian
